Decades of research demonstrate the importance of a safe, stable, affordable home as a foundation for health beginning in the prenatal period and extending over the life course. Unfortunately, in the United States today, millions of children face housing circumstances that harm their health and, as a result, increase unnecessary health care utilization. Families with extremely low incomes, particularly Black and Latinx families, are disproportionately impacted by adverse housing circumstances further exacerbating health disparities. These disparities are rooted in a long history of discriminatory policies and practices that shape the current housing landscape in the United States. In this commentary, we examine four domains of housing—quality, stability, affordability, and neighborhoods—critical for positive child health outcomes as well as policies and practices that should be employed to ensure all children live in homes that promote healthy growth and development.

Four Domains of Housing for Optimal Child Health—Quality, Stability, Affordability, and Neighborhood

Quality
Living in a home with adequate heating and cooling that is free of pests, mold, lead, second-hand smoke and other known environmental hazards and meets the accessibility needs of children with special health care needs is critical for child health. Lead exposure—currently found in an estimated 24 million homes nationwide—during early childhood irreversibly damages a child’s brain, and mold, pests, and second-hand smoke have been shown to exacerbate asthma and other respiratory conditions. All of these exposures are more likely to be experienced by children of color, which in turn exacerbates racial health disparities. The preponderance of literature linking these exposures to negative child health outcomes has led to the development of interventions, such as asthma home visiting programs, that reduce harmful indoor exposures through partnerships between housing advocacy groups, community-based providers and health care organizations.

Stability
Young children whose families move 2 or more times in a year are at risk of poor health and developmental outcomes and older children who experience residential mobility—defined variably in the literature, but often referring to frequent moves throughout childhood—are more likely to develop mental or behavioral health conditions compared to children in families who are stably housed. The impact of evictions, foreclosures, and forced displacement on child health has been increasing. Nearly 3 million families experience evictions annually in the United States and, as a result, research shows the health of children, the mental health of their mothers, and the economic stability of the family is adversely impacted. Inability to afford rent is overwhelmingly the main cause of eviction; often tenants owe landlords relatively small amounts in backed rent—in many cases, around 1 month of rent or less. Foreclosures are associated with increased health utilization, notably urgent health procedures for preventable conditions, among children and adults. When families are forced to move, either due to eviction or foreclosure, they are often displaced to lower quality housing that may further exacerbate health complications.

Homelessness—defined as living in a shelter, motel/hotel, or place not meant for human habitation—is one of the most extreme forms of instability for families and is prevalent in the United States with more 150,000 people families with children experiencing homelessness annually. Beginning in the prenatal period and extending through childhood, any duration of homelessness is
associated with adverse health, developmental, and educational outcomes.\textsuperscript{20−25} Homelessness is an area where racial disparities are particularly pronounced. While Black households make up 13% of the overall population in the United States, they account for 40% of people experiencing homelessness and are 50% of families experiencing homelessness with children.\textsuperscript{20} Further, as housing becomes more unaffordable and unavailable, homelessness increases. Research shows that in many areas of the country, even small rent increases can place thousands of people with very low incomes at heightened risks of homelessness.\textsuperscript{26}

**Affordability**

According to research from the National Low Income Housing Coalition, there is a severe shortage of 7 million affordable and available homes for renters with the lowest incomes.\textsuperscript{27} Steady increases in rent, stagnant increases in wages and chronic underfunding of federal programs to preserve and create affordable housing have contributed to this massive shortage. The number of households with very low incomes that either pay more than half their income for rent or live in severely substandard housing, and receive no housing assistance—has risen by 66% since 2001.\textsuperscript{28}

Families who struggle to afford rent are at greater risk of other economic hardships including difficulty affording food, utilities, transportation, and medical care, and children and adults in these families are more likely to have worse health outcomes than those who can afford their rent.\textsuperscript{11}

**Neighborhood**

Where a child lives, learns, and plays is important for healthy development. Intentional residential segregation, disinvestment in communities of color, exclusionary housing policies, and subprime lending practices throughout the United States have created and perpetuated health inequities across racial, ethnic, and socioeconomic lines.\textsuperscript{20,30} As a result of these intentional policies, today Black and Latinx families are significantly more likely to live in neighborhoods of concentrated poverty compared to white families, which hinders health, educational achievement, and upward income mobility.\textsuperscript{31} Studies show that when children live in stable, affordable homes located in neighborhoods with high-performing schools, safe outdoor spaces, and access to transportation and jobs, they are better able to thrive and become healthier adults.\textsuperscript{32} Across the country, however, cities and towns have wide disparities between neighborhoods and the opportunities they provide.\textsuperscript{32}

**Health Care and Clinical Transformation—What Pediatricians Can Do to Advance Housing and Health Equity**

Currently, health systems across the country are assessing health-related social needs, including housing, during clinic visits. Systematically screening families using tools such as the Housing Stability Vital Sign, Accountable Health Communities question on housing quality or others that assess multiple housing domains is critical for ensuring families living in housing situations that threaten health do not fall through the cracks.\textsuperscript{33,34} Further, health systems can use geocoded data to understand neighborhood level factors for clinical care.\textsuperscript{35} While screening for housing without an immediate solution may create concern among clinicians,\textsuperscript{36} systematically collecting information in clinics is important for understanding the scope of resource needs. Given the sensitivity of these issues, building rapport and setting reasonable expectations with families is necessary.

Once housing instability, housing quality issues, or homelessness have been identified, health systems have opportunities to provide support to families in order to improve health. These solutions may include interventions delivered at different “dose” levels. For example, “low-dose” interventions may include the provision of resource guides\textsuperscript{37} while “medium-dose” interventions may include co-locating or coordinating housing and social services in health care settings.\textsuperscript{34} For medically or socially complex families, “high-dose” interventions that integrate intensive housing case management and/or connection to high-quality, affordable housing options for patient families may be necessary.

Regardless of the model, engaging in partnerships with local housing groups, community-based providers and social services providers is an effective solution for reducing barriers for families to access resources and increasing the capacity, knowledge, and communication between clinicians and social services and housing providers.\textsuperscript{34} Given the complexity of both housing issues that may arise from screening and solutions to respond to those needs, engaging in partnerships with external organizations while also building internal clinical capacity to address housing needs may be more effective for promoting housing stability than either strategy alone. For example, a recently published randomized control trial demonstrated significant improvements in child health and parental mental health in the first 6 months of a housing intervention for medically complex families that coordinated health, housing, legal, and financial services across health care and community-based organizations.\textsuperscript{38}

Although health care institutions have begun implementing innovative interventions to address adverse housing conditions among patients, health care cannot solve this problem alone. In order to adequately meet the needs of patient families, people in the health care system must advocate to expand housing resources and to improve policies on the federal, state, and local levels. Because pediatricians see first-hand the connections between housing and health, they are uniquely positioned to advocate for better housing policy solutions through their professional associations including the American Academy of Pediatrics and with their individual institutions, if possible, to address upstream contributors to poor health and work
across sectors to improve housing location, stability and affordability to promote health equity. Pediatricians can engage in these efforts through cross-sector coalitions such as the Opportunity Starts at Home Campaign and by directly contacting the elected officials who represent them to explain why stable, affordable housing is essential to child health and to urge stronger action on housing.

**Housing Policy—Engaging Policy Makers to Address a Root Cause of Health Disparities**

Without intervention from the government, housing developers and operators cannot build, operate, and maintain quality affordable homes for people with the lowest incomes. Government subsidies are necessary to fill the gap between what people with the lowest incomes can afford to pay and the costs of developing and operating rental homes. Inaction on the housing crisis is expensive—Children’s HealthWatch estimates that unstable housing among families with children will cost the US $111 billion in avoidable health and education expenditures over the next ten years. Investing in affordable homes would generate multiplying returns, not only in the form of reduced healthcare costs, but also in new jobs, increased economic mobility, and higher educational attainment.

Achieving equity demands that we first focus finite resources on those most in need: people with extremely low incomes and other historically marginalized renters, who are, by far, more likely to struggle with the 4 domains of adverse housing that impact child health. Sixty-four percent of extremely low income households rely on the rental assistance: the Housing Choice Voucher program, which helps people with the lowest incomes afford housing in the private market by paying landlords the difference between what a household can afford to pay for rent and the rent itself, up to a reasonable amount. Vouchers are evidence-based solutions for ending homelessness and housing instability. A 2018 exploratory analysis from the National Low Income Housing Coalition estimates that the Housing Trust Fund would need $29.9 billion per year over the next decade to fully meet the needs of extremely low income renters.

- **Stabilize households in crisis through emergency rental assistance:** Most families in poverty spend at least half of their incomes on housing, leaving virtually no margin for an unexpected expense. By providing a relatively small amount of money and supportive services to families in crisis, emergency rental assistance programs can stabilize families before families are evicted, face foreclosure, or become homeless. In 2013, the Bipartisan Policy Center proposed a short-term emergency assistance program that would require $3 billion annually.

These strategies will help address all 4 domains of housing for optimal child health. For example, federal rental assistance requires minimum quality standards while also bridging the gap between rent and income for people with the lowest incomes to ensure affordability, which in turn promotes stability. There is also wide bipartisan support for a subset of vouchers—often called mobility vouchers—that provide families with low incomes the liberty to choose neighborhoods they have been historically priced out of, that receive greater funding and support contributing to higher performing schools, stronger job prospects, and other resources.

Of course, policy action can and should be taken at all levels of government, not just in Washington DC. States and localities must also expand resources as well as implement more effective policies. These solutions include passing laws or regulations that eliminate source of income discrimination, protect renters’ rights through policies including just-cause eviction and right to counsel laws, and reduce barriers to housing development that eliminate residential segregation.

**Conclusion**

A stable, affordable home in communities connected to opportunity is a prescription for good health. Unfortunately, this medication is not found on the shelves of pharmacies. This means pediatric providers and health care systems must work together across multisector partnerships and with policy makers to ensure all children live in
homes that support healthy growth and development while also promoting health equity.
